## AMINA EVOLUTION SERIES

For over a decade Amina Technologies have been selling truly invisible speakers to the market and continually improving and expanding their range. Today, choosing invisible speakers provides a solution that is aesthetically perfect and sounds great too. Ordinarily covered by a 2mm final skim of conventional plaster increasingly Amina are working with customers using a range of other finishes in front of the speaker, the most popular of which are wood/wood veneer and leather.

The flagship product range is the Amina Evolution Series. This includes the popular

AIW550E which was awarded Best Architectural Loudspeakers in SVI 2014 Awards and which is ideal for main listening rooms and home cinemas. The AIW750E is a 2 panel speaker with a bass panel that reproduces frequencies down to 50Hz and a separate, optimized, smaller high frequency panel providing the ultimate invisible Hi-Fi listening experience.

In a recent super yacht project the surround sound system in the master bedroom had Evolution Series speakers covered by Alcantara artificial leather in the ceiling for the front speakers and behind wood veneer in the bedhead for the rears.

For volume projects whether commercial or residential Amina launched the IQ Developer Series in 2013 offering a more aggressive price performance point. For 100/70V line projects Amina offer the popular LFieT series which are used in numerous designer label flagship stores and design conscious hotels throughout the world.

## NOVASONAR

It is common knowledge that interior designers and architects do not like loudspeakers. Not so much the sound they create but more the physical presence that typically ends up looking like an afterthought whether they are originally specified or not.

Whilst audio remains a necessity in some environments it has been the Holy Grail of these influencers to find solutions that provide the audio requirement with the least or virtually no visual impact as to not detract from their original concept or design. As such flat panel loudspeaker technology is the best way to custom-integrate a sound system in your residential and commercial projects. Not only do these speakers sound great but the aesthetic benefit of having invisible speakers is obvious to see (or not, depending on your point of view)!

Audible audio quality is of extreme importance to Novasonar, managing to combine high audio quality with the easiest to mount flat panels. They speakers have a natural and broad radiation pattern and physical dimensions that fit almost any wall without the need for setting in back boxes. The speaker's membrane comes from high-tech, precision aircraft manufacturing, the transducers are of the highest-quality to be robust and hard-wearing, plus the extremely easy to mount design of the Novasonar flat panel will make this speaker system the brand of choice when it comes to specification. In addition Novasonar speakers have an electronic fuse for protection, built in as standard, to safeguard against driving amplifiers into clipping. This circuit simply resets if tripped for continual safe use of the embedded speaker panels.

Built to the latest possible technical standards, Novasonar speakers offer invisible but good-quality sound; and in this light they have created a subwoofer which can be built into the wall as well. The sub is a 2-channel sub that only shows a small vent slot (1cm x 50cm), preferably mounted relatively close to the floor. The sub is 6cm deep making it easy to integrate and be kept out of sight. This product is unique and offers, together with the flat panels, an excellent way to combine the best possible interior decoration without any visual disruption.

## SONANCE INVISIBLES

The IS line of invisible in-wall/ceiling speakers is the ultimate expression of Sonance's 'degrees of invisibility' concept. The range offers installers brilliant full-frequency performance, high-efficiency and easier-installation, combined with Sonance expertise and quality to create an unparalleled no-compromise invisible speaker solution.

Eighteen months in the making and incorporating high-performance planar driver diaphragms protected by a plaster-ready paper surface, four IS models offer the opportunity for truly invisible full-range multi-channel, stereo and single stereo audio systems in virtually any interior space. The Sonance IS2 is a two-way design incorporating a 27cm/sq planar tweeter and 320 cm/sq. planar woofer; the IS4 is a three-way model with a 110cm/sq planar midrange driver and larger 732 cm sq. planar woofer. Next up, the IS4SST is a single stereo speaker having a dual voice-coil version of the IS4 spec; and for the deepest bass, the ISW2 in-wall/ceiling woofer, featuring a 1098cm/sq. planar bass driver, completes the range.
